CHARLES C THOMAS • PUBLISHER

SYNOPSIS OF PATHOLOGY FOR THE ALLIED HEALTH PROFESSIONS by Alvin F. Gardner, Food and Drug Administration, Washington, D. C. This comprehensive, authoritative review of up-to-date information on general pathology is designed expressly for students and professionals in the allied health and nursing fields. Throughout the text, the author clearly demonstrates the fundamental principles of pathology and succinctly summarizes pathologic processes in systemic diseases. He focuses on important ideas and recent developments in this field and stresses the necessity of continuing medical education. Virtually the entire field of general pathology is covered. A sampling of chapters includes Congenital Anomalies and Hereditary Diseases; Diseases of Aging; Acute Infectious Diseases; Viral and Rickettsial Diseases; Diseases Due to Physical Injuries, Chemical Poisons, and Thermal and Irradiation Injuries; Nutritional Deficiency; The Respiratory System; The Endocrine System; The Breast; and The Skin. '79, 480 pp., $34.50

REGIONAL BLOCK: A Handbook for Use in the Clinical Practice of Medicine and Surgery (4th Ed., 9th Ptg.) by Daniel C. Moore, Virginia Mason Hospital, Seattle, Washington. For each of the numerous blocks presented, the author provides explicit step-by-step instructions, including indications, anatomy, premedication, drugs, materials, technique, and possible complications. Major sections cover fundamental considerations; peripheral nerve block anesthesia for the head and neck, trunk, and extremities; and spinal, epidural, nerve block anesthesia for the head and neck, trunk, and extremities; and spinal, epidural, and caudal anesthesia. '79, 532 pp. (6 3/4 x 9 3/4), 555 ill., $21.75

RESPIRATORY INTENSIVE CARE edited by Robert M. Rogers, Univ. of Oklahoma Health Sciences Center, Oklahoma City. (38 Contributors) Logically organized chapters cover logistical and administrative considerations in establishing and maintaining a respiratory intensive care unit, acid-base balance, ventilatory and nonventilatory therapeutic modalities, rehabilitation of the chronic obstructive pulmonary patient, fiberoptic bronchoscopy, and management of the postoperative patient. '77, 448 pp., 138 il. (3 in color), 36 tables, $34.00

CARDIOVASCULAR PHYSIOLOGY FOR ANESTHESIOLOGISTS by Ronald Gordon, Univ. of Florida, Gainesville; Mark B. Ravin, Univ. of Kentucky, Lexington; and George Daicoff, Univ. of Florida, Gainesville. Information is presented on cardiac output and regional blood flow distribution, the fundamentals and clinical aspects of blood rheology, venous return, and cardiac function curves. Also examined are general considerations in coronary circulation and anesthesia for surgical correction of congenital heart disease. '79, 224 pp., 63 il., 30 tables, $19.75

REGIONAL BLOCKS FOR NURSE ANESTHETISTS: A Technical Manual by Phyllis Adams Roberts, Des Moines, Iowa. This unique text provides detailed, clear descriptions of methods for administering spinal, axillary block, and intravenous regional anesthesia. The book opens with general considerations and prerequisites for regional anesthesia followed by discussions on commonly used drugs, premedication drugs, and dosage calculations. Subsequent chapters detail various techniques of drug administration, ranging from patient position and needle hold/approach to prevention of hypotension. Remaining chapters focus on the patient's anesthetic record and anesthetic management in light of the patient's condition and his/her operation. Precise step-by-step procedures are clarified by numerous illustrations. '78, 128 pp., 26 il., 1 table, $9.75

MECHANICAL ARTIFICIAL VENTILATION: A Manual for Students and Practitioners (3rd Ed.) by Terring W. Heironimus III and Robert A. Bageant, both of Univ. of Virginia Medical Center, Charlottesville. This monograph reviews the physiology of respiration, diagnoses and characterizes the various forms of respiratory failure and their management, and discusses equipment and hardware. Sections on oxygen therapy, airway humidification, and artificial airways are accompanied by material on pulmonary oxygen toxicity, pulmonary function testing, resuscitation of the terminally ill, critical care complex organization, and the effects of cigarette smoking. '77, 560 pp., 98 il., 10 tables, $28.25

QUICKLY BECOMING THE DRUG OF CHOICE FOR REVERSING PROLONGED SOMNOLENCE, DELIRIUM AND OTHER ANTICHOLINERGIC SIDE EFFECTS.

More Surgical Teams are relying on ANTILIRIUM because...

- Patients are revived in minutes after I.V. administration.
- Reverses anticholinergic side effects.
- Patient safety—metabolized in the body in 60 to 120 minutes.

ANTILIRIUM CROSSES THE BLOOD BRAIN BARRIER WHEREAS NEOSTIGMINE DOES NOT

ANTILIRIUM, unlike other anticholinesters including neostigmine does not have a quaternary nitrogen atom, but has a tertiary amine. For this reason it is non-ionized and rapidly crosses the blood brain barrier.
ANTILIRIUM
(Physostigmine Salicylate)

Brief Summary (Please consult full package insert, enclosed in every package, before using Antilirium)

DESCRIPTION: ANTILIRIUM Injection (physostigmine salicylate) is OJF's brand of physostigmine salicylate.

ANTILIRIUM INJECTION 1 mg./ml.
FOR INTRAMUSCULAR OR INTRAVENOUS USE
Each ml. contains:
PHYSOSTIGMINE SALICYLATE 1 mg.
In a vehicle composed of Sodium Bisulfite 0.1%, Benzy1 Alcohol 2.0%, in water for injection q.s.

ACTION Antilirium (physostigmine salicylate) inhibits the destructive action of cholinesterase and thereby prolongs and exaggerates the effect of the acetylcholine. The changes in body function which are produced by the injection of physostigmine are: therefore, very similar to those which would occur from simultaneous stimulation of the parasympathetic nerves and include contraction of the pupil, increased tonus of the intestinal musculature, constriction of the bronchi and stimulation of secretion of the salivary and sweat glands.

Antilirium contains a tertiary amine and easily crosses the blood brain barrier. While neostigmine contains a quaternary amine and is not capable of crossing the structure. This may explain why neostigmine does not cause reversal of anticholinergic-induced delirium while physostigmine does.

Antilirium, one of the anticholine esterases which is a tertiary amine, crosses into the central nervous system and can reverse both central and peripheral anticholinergic actions.

The anticholinergic syndrome has both central and peripheral signs and symptoms. Central toxic effects include anxiety, delirium, disorientation, hallucinations, hyperactivity, and seizures. Severe poisoning may produce coma, medullary paralysis, and death. Peripheral toxicity is characterized by tachycardia, hyperpyrexia, mydriasis, vasodilatation, urinary retention, diminution of gastrointestinal motility, decrease of secretion in salivary and sweat glands, and loss of secretions in the pharynx, bronchi, and nasal passages.

Some drugs in the anticholinergic group, such as imipramine and related tricycles also produce additional toxic effects such as cardiac arrhythmias which can be reversed by physostigmine.

Dramatic reversal within minutes of coma, hallucinations, and other signs can be expected if the diagnosis is correct and the patient has not suffered anoxia or other insult. Toxic effects from mixed drug ingestions and combination preparations such as amitriptyline and perphenazine may respond less dramatically. Since physostigmine is rapidly metabolized, therapeutic doses may be necessary at intervals as life-threatening signs such as arrhythmias, convulsions, and deep coma recur. Physostigmine is destroyed in the body in 60 to 120 minutes.

INDICATIONS: TO REVERSE THE TOXIC EFFECTS UPON THE CENTRAL NERVOUS SYSTEM CAUSED BY DRUGS IN CLINICAL OR TOXIC DOSAGES CAPABLE OF PRODUCING ANTICHOLINERGIC POISONING.

CONTRAINDICATIONS: Physostigmine salicylate injections should not be used in the presence of asthma, gangrene, diabetes, cardiovascular disease, mechanical obstruction of the intestines or urogenital tract or any vagotonic state, and in patients receiving choline esters or depolarizing neuromuscular blocking agents (decamethonium, succinylcholine).

WARNING: If excessive symptoms of salivation, emesis, urination and defecation occur, the use of Antilirium should be terminated. If excessive sweating or nausea occur, the dosage should be reduced.

Intravenous administration should be at a slow, controlled rate, no more than 1 mg. per minute (see dosage). Rapid administration can cause bradycardia, hypersalivation leading to respiratory difficulties and possibly convulsions. An overdosage of Antilirium can cause a cholinergic crisis.

PRECAUTIONS: Because of the possibility of hypersensitivity in an occasional patient, atropine sulfate injection should always be at hand since it is antagonist and antidote for physostigmine.

ADMINISTRATION AND DOSAGE: The usual adult dose of Antilirium is 0.5 to 2.0 mg. intramuscularly or intravenously. Intravenous administration should be at a slow, controlled rate of no more than 1 mg. per minute. It may be necessary to repeat dosages of 1 mg. to 4 mg. at intervals as life threatening signs such as arrhythmias, convulsions and deep coma recur. Physostigmine salicylate is rapidly metabolized in the body.

IN ALL CASES OF POISONING, THE USUAL SUPPORTIVE MEASURES SHOULD BE UNDERTAKEN.

CAUTION: Federal law prohibits dispensing without prescription.

HOW SUPPLIED: Ampuls, 2 ml. packed 12 per box.

ANTILIRIUM INJECTION 1 mg./ml.

This little old lady has arthritis.

Arthritis is not just an old folks' disease. Over 250,000 youngsters, many of them still in the cradle, suffer from it.

Arthritis is not just aches and pains. It attacks joints from the shoulders to the feet. It may attack the liver, heart, spleen. It may cause cataracts and blindness. It may even kill.

Children suffering from arthritis can be helped. With early diagnosis, long-term treatment. And by informed parents. Learn the facts about this cruel disease. Contact the Arthritis Foundation in your area today.
